The Capacity Boosters
Our graphite based battery solutions
SIGRACELL®
SIGRACET®
SIGRACELL® materials for batteries
Enhancing energy storage for tomorrow’s needs

We produce high-quality graphite material for lithium-ion battery anodes amounting to double-digit thousands of tons each year. Fueling battery gigafactories with our products is our mission. And we are able to scale up volumes as requested – always maintaining the high performance that characterizes all of our materials. That’s why our products really are “capacity boosters” for energy storage systems, which will help usher in the new era of energy.
GWh
**Our graphite based battery solutions**

With their optimized electrochemical profile and material purity, our materials and products for battery electrodes meet the highest standards for quality, efficiency and environmental compatibility.

---

**Lithium-ion batteries**
- Mobility (automotive, buses, trucks, forklift trucks)
- Consumer electronics (cameras, mobile phones, computers)
- Industrial applications (power tools)
- Stationary applications (from home storages to grid-scale systems)

**Lead acid batteries**
- Mobility (starter batteries for automotive)

**Typical applications**
- Mobility (automotive, buses, trucks, forklift trucks)
- Consumer electronics (cameras, mobile phones, computers)
- Industrial applications (power tools)
- Stationary applications (from home storages to grid-scale systems)

**Materials made of carbon and graphite**
- Graphite anode materials
- Carbon composite anode materials
- Conductive carbon additives
- Graphite based solutions for battery thermal management
- Battery housing

**SGL Carbon products**
- SIGRACELL® specialty graphites
- SIGRACELL® synthetic graphite powders
- SIGRACELL® expanded graphite powders

---
Our customers benefit from energy storage with increased performance and reliability in a wide range of applications across all relevant industries. We provide tailor-made solutions based on our long-term experience and close development partnerships, including the option of large-scale production.

Redox flow batteries
Vanadium (VRFB) or Zink-bromine (Zn-Br)
- Stationary applications (from home storage to grid-scale systems)

Proton exchange membrane (PEM) fuel cells
- E-mobility (automotive, trains, trucks, buses & forklifts)
- Stationary power generation and back-up power
- Power chargers for consumer electronics

- Electrodes
- Bipolar plates

- Gas diffusion layers (GDL)
- Separators and bipolar plates

- SIGRACELL® battery felts
- SIGRACELL® bipolar plates

- SIGRACET® carbon paper
- SIGRACELL® graphite foils
Products for lithium-ion batteries

Thanks to our extensive expertise, we offer the broadest range of customizable high-quality products and solutions for lithium-ion batteries.
We are a leading specialist for carbonization and graphitization, covering every phase from the purchasing of raw materials to continuously high-quality mass production. Our versatile process enables us to customize products for a high variety of application requirements, e.g., for the automotive industry, stationary energy storage, consumer goods or power tools.

**Expertise and innovation**

In 20 years of delivering materials at the leading edge of technology, we have gained profound expertise in lithium-ion batteries. At the same time, we strive to strengthen the connection between research and industry to foster innovation, e.g., in communities devoted to this purpose like the German Competence Network for Lithium-Ion Batteries (KLIB).

With the state-of-the-art equipment for mixing of slurries and coating of electrodes as well as for building of two- and three-electrode pouch, Swagelok and coin cells in our modern laboratories, we can conduct testing of our tailored materials, developed to our customers’ specifications. Tests for both graphite materials and innovative carbon silicon composites can be adjusted to customer needs.

**Global presence**

SGL is a global top player in synthetic graphite anode materials for lithium-ion batteries and the only significant western manufacturer. Our sites in Europe and the United States are located close to the production facilities of relevant OEMs and in regions of planned battery production lines. Our Asian locations are also close to the main markets of lithium-ion batteries.

**Quality and volume**

Through decades of experience as a graphite producer, we have established a sophisticated supply chain benefitting from long-term relationships with raw material suppliers. This allows us to ensure both large volume deliveries and high-quality results.

---

**Our products for lithium-ion battery application**

- Graphite anode materials
- C/Si composites
- Additives
- Solutions for battery thermal management
- Battery housing

† Glove-box for cell building. In our laboratory we produce cells for testing according to standard and customized protocols.
Backed by decades of experience and reliable, mass and diversified production, we are able to provide synthetic graphite for anode materials at the highest quality level. As a large-scale producer, we also profit from our highly developed knowledge and skills along the complete value chain.

**Purity for top-level requirements**

We execute graphitization at technically highest possible temperatures leading to highest purity and optimized product performance. By our long term experience and know-how in production process control, we have reduced batch-to-batch variations to a minimum. Additionally, our high production capacity and special process design allows us to quickly scale up delivery volumes. These aspects ensure that our graphite meets the requirements of high-end applications: performance, reliability, quality, and safety.

**Customization**

Our highly versatile production process allows us to influence various material parameters – from the selection of raw materials to carbonization and graphitization, as well as properties of the final product. This enables us to flexibly adapt our products to special application requirements.

---

**Advantages of synthetic graphite over natural graphite**

- Better cycling stability
- Better fast charging performance
- Higher quality consistency
- Faster production scalability

---

**We design products with the cost-performance profile you need**

---

**With material properties we control electrochemical battery performances**
Additives for cathodes

We offer a large portfolio of additives based both on synthetic graphite and processed natural graphite. Due to their high degree of graphitization, our powders show an extremely high electrical conductivity which significantly increases the performance of the battery. Furthermore, the high level of purity and the surface area control avoid any unwanted reaction within the cell.

SGL designing material to address customers' needs

Combining favorable properties

Our C/Si composite anode material integrates carefully tailored silicon-based materials with our optimized high-performance graphite anode materials to boost the anode's capacity beyond graphite's theoretical limits. Highly conductive carbon and graphite allow usage in high-power applications and foster excellent process ability to electrodes like state-of-the-art graphite anodes.

Carbon for high performance ...

The carbon structure enables an attractive electrochemical performance profile, such as high coulombic efficiency, processability and an improved cycle life.

... silicon for energy density and high power

The use of silicon in the anode results in increased gravimetric and volumetric energy density and fast charging capability for our customers, especially when compared to other materials that meet the requirements for high energy applications.

Carbon-based additives for lead acid batteries

Designed according to the latest research results, SIGRACELL materials significantly improve battery performance.
The Capacity Boosters | Lead acid batteries

Performance, conductivity, purity, particle shape
We offer a large portfolio of additives for lead acid batteries based on synthetic graphite, natural graphite and carbon fibers. We ensure the best solutions for our customers, with products that combine electrical conductivity, high purity and optimized particle shape.

Excellence through research
Our own focus on research as well as our extensive R&D network put us at the forefront of material development. This allows us to integrate the most recent scientific findings into our production of additives. We provide tailor-made solutions featuring an enhanced dynamic charge acceptance (DCA) in combination with low hydrogen development and improved cold-crank-ability.

Key advantages
- Significant improvement of DCA
- High cycling stability
- Very low levels of metal impurities
- Excellent wettability
- Easy to mix into the lead paste
- Combination with conductive carbon blacks possible

Graphite-based solutions for redox flow batteries

We provide reliable components that can be adapted to different requirements – from batteries for home storage to grid-scale energy storage systems with 20 megawatt hours or more.

Electrolyte tanks belonging to the energy storage system in Pfinztal, near Karlsruhe, each holding 45,000 liters. The 20 MWh system, run by the Fraunhofer Institute for Chemical Technology and equipped with SGL materials is part of the RedoxWind project supported by the German federal state of Baden-Württemberg and the Federal Ministry of Education and Research. © Fraunhofer-Institut für Chemische Technologie ICT
Ideal for stationary applications
Redox flow batteries enable energy storage on a scale of kWh to MWh and provide the perfect solution for stationary applications. Their main advantage is, that output [MW] and energy [MWh] can be adjusted independently of one another. This makes them easily adaptable to the specific requirements at hand.

Expertise for enhanced performance and service life
We rank among the leading manufacturers of specialty graphite components for redox flow batteries. We have applied our long-term experience and close cooperation with customers to develop our SIGRACELL battery felts, bipolar plates and endplates. By constantly improving our materials, we significantly enhance the performance and service life of our customers’ batteries.

Optimizing performance through felt quality
Inhomogeneity in the battery felt can lead to impermeable areas that reduce overall system performance. As a result, we are continuously working on tighter tolerances for the area weight and thickness of our battery felts. This helps our customers optimize compression rates, thus ensuring the best possible battery performance.
**SIGRACELL® battery felts**

**Ideal properties for an efficient charge exchange**
Permeable electrodes made of SIGRACELL carbon and graphite felts are the first choice for high-temperature batteries like redox flow batteries. Our felts are used for anodes as well as cathodes. Thanks to a unique combination of electrical conductivity, electrochemical stability, high porosity and good elasticity, they facilitate an efficient charge exchange between the electrolyte and the bipolar plate.

**Felt activation for enhanced performance**
As graphitized felts are non-wetting towards aqueous electrolytes, activation is strongly recommended in order to avoid slowdown of charge transfer and large resistances. We offer felt activation through thermal surface oxidation. This treatment induces wettability by generating hydrophilic surface functions while preserving the structural integrity of the fibers, since the burn-off only affects a few percent.

**Adaptable sizes – including large-scale needs**
The sizes we provide are even enough to cover the needs of large-scale redox flow systems. We supply battery felts in standard sizes up to 1350 mm (53") in width in 25 m (82 ft) rolls. Beyond that, we produce carbon and graphite felts in customer-specific dimensions.

SIGRACELL® bipolar plates and end plates

Resistance to chemicals meets high conductivity
The main features that distinguish expanded natural graphite are exceptional resistance to chemicals and good electrical conductivity. Together with high-grade fluoropolymers, our thin, high-density SIGRACELL bipolar plates can be used for a broad spectrum of applications. Thanks to their great resistance to corrosion, they are ideally suited for the demanding cell chemistry in battery systems.

Carbon-based products for fuel cells

Our SIGRACET® gas diffusion layers (GDL) excel in performance, durability and adaptability to different applications.
Gas diffusion layers (GDLs) are key components of proton exchange membrane (PEM) fuel cells. They modulate all relevant transport processes concerning reaction products, electricity and heat.

**Designed for high performance**
Our high-performance products are the result of continuous research. We tailor their material properties to meet the requirements of the intended application. Our customers benefit from our know-how in fine-tuning the physical and electrochemical attributes of our materials to optimize their interaction with other cell components.

**Great variety**
Thanks to our sophisticated production process, we can offer a broad range of GDLs with variable thickness and porosity, each suited for a specific set of applications based on its physical attributes. Our portfolio has an extensive selection of GDLs for dry or wet operating conditions, based on their electrochemical attributes. For example, GDLs for dry conditions are designed to prevent membrane dehydration. We also offer solutions if high gas diffusivity is needed.

**Other applications**
Our GDLs can also be used in electrochemical applications, such as redox flow or metal air batteries as well as for microbial fuel cells and PEM electrolysis.

Successful together

Lithium-ion batteries are complex electrochemical systems involving dozens of components, all of which react with each other. Changing a single property of just one component can lead to a significant change in the entire cell.

This is why it is so crucial to test our materials according to our customers’ specifications. Our laboratory meets this need and provides full characterization of the materials under different conditions. We also carry out further tests in collaboration with universities and research institutions.

As a result, we can deliver material with a characterization that is as close as possible to our customers’ own characterization, helping to accelerate development and upscaling processes at customers’ end.
A laboratory for tailor-made solutions

Special tests
We test according to the conditions of our customers.

Adjusting the electrode recipe
We adjust our standard electrode recipe to match the ones used by our customer.

Testing of properties
We test the properties of electrodes (e.g. adhesion and cohesion, particle orientation, wetting, SEM) according to customer specifications.

Use of same cathode type
We can use a cathode type identical or similar to those of our customers.

Adapting electrolyte and additives
We apply an electrolyte composition and/or additives identical or similar to the ones of our customers.

Variable test conditions
We can change the electrochemical characterization test conditions (e.g. C-Rate, cycling type, cycling temperature, storage condition, etc.) according to our customers’ requirements.

Measuring swelling and gas
We measure the swelling of the electrodes and the gas development in a pouch cell.

Pouch, Swagelok and coin cells
Our cutting-edge equipment also enables us to build two- and three-electrode pouch, Swagelok and coin cells.
Smart Solutions

Be it materials, components or production processes, we focus our thinking and actions on the customer and keep an eye on the big picture. Our solutions already anticipate the future today.

The following examples show a selection of our unique product range.

Mobility

- Lightweight components and structural parts based on fiber-reinforced composites for automotive and aerospace manufacture
- Graphite anode material for lithium-ion batteries in electric vehicles
- Carbon-ceramic brake disks for sports cars and luxury sedans

Energy

- High-temperature solutions based on specialty graphites and fiber materials for the photovoltaic industry
- Carbon fiber materials for rotor blades
- Gas diffusion layers for fuel cells
- Systems for more efficient heat exchange and heat recovery
- Carbon fibers for pressurized gas containers

Digitization

- Carbon, graphite, and CFC components for polysilicon and monocrystal pulling in the semiconductor industry
- High precision, coated graphite carriers for the production of LEDs

→ State-of-the-art green production with the world's largest isostatic press
We are leaders in the development and manufacture of products based on carbon, graphite, carbon fibers, and fiber-reinforced composites. In partnership with our customers, we develop intelligent, trendsetting, and sustainable solutions that deliver a clear benefit.

With our in-depth material, engineering, and application know-how, we make a substantial contribution to the major future topics mobility, energy, and digitization.
